«Superlight» Speed and tunneling time in L. Wong's Experiment

Abstract: In 2000, it was reported that the impulse of light in a chamber with tseium vapor was 310 times the speed of light. Experiment L. Wong (USA). So the impulse leaving the chamber managed to move away to 19 meters before the incoming one reached the front wall of the chamber. This post is devoted to the analysis of this phenomenon.

Key words: tunneling, superlight speed, light-like lines, potential barrier, negative time
